What will we cover?

- Hydraulic Design Basics
- Hydrologic Analysis
- Hydraulic Analysis
- Gutterflow
- Hydraulic Grade Line
HYDRAULIC DESIGN BASICS
Hydraulic Design Standards

- Complete a Hydraulic Review/Report
- What can be used for Hydraulic Design
  - NDDOT Design Manual Section V
  - Code of Federal Regulations
  - U.S. DOT Federal Highway Administration Hydraulic Engineering Circular No. 22 Urban Drainage Design manual
- Classify the Highway to determine the design flood frequency
- Analyze the Water Surface Profile
Why do we design storm drainage systems?

“The objective of highway storm drainage design is to provide for safe passage of vehicles during the design storm event. The drainage system is designed to collect stormwater runoff from the roadway surface and right-of-way, and discharge it to an adequate receiving body without causing adverse on- or off-site impacts.”

-HEC 22
What is Hydrology

- According to Dictionary.com, Hydrology is the science dealing with the occurrence, circulation, distribution, and properties of the waters of the earth and its atmosphere.
- Hydrology in the NDDOT’s application is better defined as estimating flood magnitudes as the result of precipitation.
What does Hydrologic mean?

According to FHWA’s HEC 22 Urban Drainage Design Manual Hydrologic is defined as:

- Losses of rainfall that do not contribute to direct runoff. These losses abstraction include water retained in surface depressions, water intercepted by vegetation, evaporation, and infiltration.
Hydrologic Vs. Hydraulic

- Hydrologic deals with rainfall while Hydraulic deals with flow of water in pipes
HYDROLOGIC ANALYSIS
Hydrologic Analysis

- Analysis Considerations
- Approved Methods
- Rational Method
  - Step 1
  - Step 2
Hydrologic Analysis

- Analysis Considerations
  - Drainage Basin Characteristics
    - Size
    - Slope
    - Land use
    - Soil Type
    - Surface Infiltration/cover
    - Storage
Hydrologic Analysis

- Analysis Considerations
  - Storage potential
    - Overbank
    - Reservoirs
    - Channels
    - Ditches
    - Etc.
Hydrologic Analysis

- Analysis Considerations
  - Type of Precipitation
    - Rain
    - Snow
    - Hail
    - Combination of the above
Hydrologic Analysis

- Analysis considerations
  - Flood plain characteristics
  - Rainfall amount and storm distribution
  - Ground cover
  - Type of soil
  - Prior moisture condition
  - Watershed development
  - Terrain
Hydrologic Analysis

• There are many different approved methods
  • For urban drainage areas the method most generally used by NDDOT is the Rational Method
    ▪ More detail to come
  • Other accepted methods for Hydrologic design
    ▪ FHWA method
    ▪ “Hydrology Manual for North Dakota” published by the Natural Resources Conservation Service
    ▪ Suitable hydrograph methods may be used for routing calculations to decrease peak flows, after the peak flow has been determined
Rational Method

- **Step 1 – Determine Contributing Drainage Area**
  - Look at contour maps
  - Consider structures and manmade changes
  - Use your common sense and best engineering judgment
Rational Method

- **Step 2 – Compute Runoff**
  - Urban Design uses the rational method
    - Q = CIA
      - Q = maximum design rate of runoff, cfs
      - C = runoff coefficient representing a ratio of runoff to rainfall
        - See Design Manual Appendix V-03 A
      - I = Average rainfall intensity for a duration equal to the time of concentrations for a selected return period, in/he
        - See Design Manual Appendix V-03 C
      - A = drainage area tributary to the design location, acres
## Appendix V-03A  Rational Method - Runoff Coefficients

*When selecting n, consider cover to a height of about 30 mm. This is only part of the plant cover that will obstruct sheet flow.
Rational Method

• **Step 2 – Compute Runoff (continued)**
  • **Time of concentration**
    - I – The rainfall intensity determined from NDDOT graphs in Appendix V-03 C pages 1 through 15.
      - The graphs are for 15 major cities in North Dakota
Rational Method

- Step 2 – Compute Runoff (continued)
  - Time of concentration
    - After imputing other basic information with the assistance of Microsoft Excel you can do some iteration to determine the time of concentration
HYDRAULIC METHOD
Hydraulic Methods

- Using Time of Concentration and the rest of the information equated through the rational method and begin to compute the flow of water in the inlet and pipes.
- This portion is determined by examining the elevations of inlets, the slopes and parts full for each pipe section as well as the pipe sizing to determine the most efficient and cost effective design options.
Gutter Flow

- Gutter Flow is unique in the fact that you must use hydrologic as well as hydraulic methods of analyzing
- Spread on Pavement
- Gutter Velocity/Slope
Gutter Flow

- Interception
  - If an inlet is on grade you must determine how much of the flow it will intercept.
  - Another analysis that you might need to do is determine how much of the flow you want to intercept at the specific inlet and then depending on your surrounding constraints adjust your inlet to meet the desired intercept.
Gutter Flow

• Flow into the inlet
  • The easiest way to determine how water will flow, at what rate, and how much is by using the hydrologic methods that were previously discussed specifically the rational method
Gutter Flow

- Spread on the pavement
  - What is Spread?
    - A measure of the transverse lateral distance from the curb face to the limit of the water flowing on the roadway
  - Drain inlets are sized and located to limit the spread of surface water onto travel lanes
Gutter Flow

- Gutter Velocity/Slope
  - Gutter Velocity is directly related to determining the flow time in a gutter which is essential to urban drainage design.
  - To determine gutter flow and velocity Mannings equations is used.
HYDRAULIC GRADE LINE
Hydraulic Grade Line

- Up to this point of Hydraulic Design you have analyzed the movement of the water before and once it gets to the pipe.
- Now the level of the water within the pipe itself must be analyzed.
Hydraulic Grade Line

What is Hydraulic Grade Line?

According to HEC 22 hydraulic Grade Line is:

- A line coinciding with the level of flowing water at any point along an open channel.
- For purposes of storm drain design Hydraulic Grade Line is used to determine the acceptability of a proposed storm drainage system by establishing the elevation to which water will rise when the system is operation under design conditions.
I can't respond to any emails today.

Something has crashed on my computer ...

Thank You!!!
