Introduction

2009 DOTSC Student Seminars July 30, 2009

How are they Derived?

I. Ride Scores

- Measurement: roughness is typically quantified using a form of either Present Serviceability Rating (PSR) or International Roughness Index (IRI).
- Present Serviceability Rating (PSR)
 - Based on individual observation
 - > Defined as the judgment of an observer as to the current ability of a pavement to serve the traffic it is meant to serve.
 - Range: 5 (excellent or very smooth) to 0 (essentially impassable)

PSR Form

- International Roughness Index (IRI)
 - Based on the average rectified slope (ARS).
 - ARS: a filtered ratio of a standard vehicles accumulated suspension motion divided by the distance traveled by the vehicle during the measurement.
 - o Metric units (m/km)
 - English units (in/mile)

How are they Derived?

II. Distress Scores

- Measurement: can be either subjective or objective
 - Subjective: may be a rating of high, medium, or low based on a brief visual inspection
 - > Objective: generally more expensive to obtain, uses different types of automated distress detection equipment.
- Established rating systems that associates penalty points with specific distress type, severity, and extent combinations.
 - These points can be summed and subtracted from some upper limit or maximum value (99 in North Dakota's case) to give an overall rating of a pavements structural condition.
 - The equations that describe how to convert from severity and extent of a certain type to an index number, or score, vary from state to state and can rather be complex.

Types of Equipment and Measurement Techniques

I. Ride Scores

- Rod and level Survey
 - A survey (performed by a survey crew) provides an accurate measurement of the pavement profile
 - > The use of surveys for large projects is impractical and cost prohibitive.

- Dipstick Profiler
 - Can be used to collect a relatively small quantity of pavement profile measurements.
 - ➤ A strip can be surveyed by a single operator in about one-half the time of a survey crew.
 - ➢ Commonly used to measure a profile for calibration of more complex instruments.

Types of Equipment and Measurement Techniques

- Profilographs
 - Not practical for network condition surveys
 - Most commonly used for rigid pavement construction inspection, quality control, and acceptance.

- Response Type Road Roughness Meters (RTRRMs)
 - Adequate for routine monitoring of pavement network and providing an overall picture of the condition of the network
 - Can provide managers with a general indication of the overall network condition and maintenance needs.
 - Measures the vertical movements of the rear axle of an automobile or the axle of a trailer relative to the vehicle frame.

Types of Equipment and Measurement Techniques

- Profiling Devices
 - > Used to provide accurate, scaled, and complete reproductions of the pavement profile within a certain range.
 - Equipment can be expensive and complex
 - Usually installed in vans that contain microcomputers and other data handling and processing instrumentation
 - Profiles are used to calculate a mathematical measure of roughness and an estimate of rutting at specified intervals along the roadway.

Types of Equipment and Measurement Techniques

II. Distress Scores

- Older Method (Visual Method)
 - Used teams of individuals who drove across every mile of pavement to be measured and visually measured the distress of the pavement.
- Newer Methods (High-Speed Video Imaging)
 - Records pavement surface video images at highway speeds using a specially equipped van.
 - > Evaluation is either done manually or automatically.
 - Manually: video is played back on specially designed workstations while trained crews rate the recorded road surface.
 - Automatically: road surfaces are recorded automatically by computer software.

SUPPORT CENT

How Does the NDDOT Derive and Use the Pavement Condition Scores?

• NDDOT Methods of Measurement

▶ Ride Score: Use IRI Scores and the IRI ranges to describe ride quality.

>Ride scores are listed in the Hwy Information Booklet, but pavement management is no longer using these to describe ride quality.

Distress Score: Uses a condition rating system that associates deduct points with specific distress type, severity, and extent combinations.

- NDDOT Highway Information Booklet
 - ≻Acronyms
 - ➢Pavement Condition Rating Deduct Values
- Where to find pavement distress and Ride Scores for state and US roads in North Dakota?
 ➤ Mainframe/Rims
- Questions

Flexible Pavement Condition Rating Deduct Values

| CONDITION | | EXTI | ENT | | SEVERITY |
|-----------------|-------------|----------|-----------|-------|--------------------------|

| RUTTING RT | 0 | 4 | 9 | 18 | WITH 20% TRIGGER |

INTRODUCTION

This report contains summary information of the pavement condition data collected in the fall of 2008. It is a compilation of information related to the pavement distress, IRI, traffic volumes, and construction history, of the North Dakota state highway system for the District referenced on the cover. Much of the data is presented in a more general form than its original source. While more detailed information can be obtained by going directly to individual files, this report provides an accurate overall picture of the state highway system for the referenced District. Similar books are available for the other 7 Districts.

| Category | Distress | IRI (in/mile) | Rut (in) |
|-----------|----------|---------------|-----------|
| Excellent | >=98 | 0-60 | <0.25 |
| Good | 88-97 | 61-99 | 0.25-0.37 |
| Fair | 77-87 | 100-145 | 0.38-0.50 |
| Poor | <77 | >145 | >0.50 |

PAVEMENT MANAGEMENT CONDITION RATINGS

DISTRESS SECTION RANKING

This section contains a ranking of all highway segments for the District sorted by distress score from worst to best. Manual "scoring" is done to arrive at a distress score. A distress score of 99 is the starting point and describes a pavement with no distresses. Deduct values are assigned to distresses and are subtracted from 99 to arrive at a distress score. The lower the distress score, the worse the pavement distress condition. Sections that were not scored will have a -1 in the distress score column.

IRI SECTION RANKING

This section contains the ranking of project segments from worst to best, based on the International Roughness Index (IRI). The IRI is a measure of pavement smoothness that is calculated from the longitudinal profile of the roadway surface. The higher the IRI, the worse the pavement surface smoothness. Sections that were not scored will have a -1 in the IRI column. The IRI category ranges were modified in fall 2008.

MAINTENANCE SECTION RANKINGS

Due to software changes to the maintenance data system in 2004, we are not able to query this data at this time

MISCELLANEOUS INFORMATION

As stated previously, the IRI ranges were modified in fall 2008. The following chart shows the history of the IRI ranges, since there was also a revision to the IRI ranges in 2004. This is provided for informational purposes only. Any past IRI value can be compared to the current ranges.

| Category | 2003 & earlier IRI Ranges | 2004-2007 IRI Ranges | Current IRI Ranges (adopted 2008) |
|-----------|------------------------------|-------------------------|---|
| Excellent | 0-60 | 0-80 | 0-60 |
| Good | 61-95 | 81-129 | 61-99 |
| Fair | 96-132 | 130-177 | 100-145 |
| Poor | >=133 | >177 | >145 |

The following scale is used to categorize average rut.

| Category | Rut (in) |
|-----------|-----------|
| Excellent | <0.25 |
| Good | 0.25-0.37 |
| Fair | 0.38-0.50 |
| Poor | >0.50 |

Average rut (inches) is calculated as the average of the raw rut data collected for the mile. The rut deduct used in the distress score is arrived at by a severity analysis. The category, from the rut scale above, with the worst 20% of the values is used to assign the deduct.

PRPI and Ride scores are listed in this document; however pavement management is no longer using these measures to describe ride quality. Refer to the IRI score and the IRI ranges to describe ride quality.

On Line

All data found in this book is easily accessible and in more detail through the mainframe database. Contact the RIMS coordinator in your district or division or the Pavement Management and Scoping Section of Planning & Programming Division if you need help in using the mainframe.

This document was created by the Planning and Programming Division's Pavement Management and Scoping Section. Please forward any comments on this document to Jane Berger, PE, at 328-2607 or by email at jeberger@nd.gov. Further assistance pertaining to this document may also be obtained from Dirk Kienzle at 328-1219 or by email at dikienzl@nd.gov.

PROJECT SPECIFIC CONSTRUCTION, TRAFFIC, DISTRESS, RIDE, AND MAINTENANCE DATA (LISTING)

The various fields of information and their sources are as follows:

| D - District |
|---|
| Hwy - Highway |
| S - Suffix(900 mileage will have a B here for business loop) |
| D - Direction |
| From Ref Pt - Reference point defining start of project section |
| From Offset(mi) - Distance from a reference point, defining start of a project |
| To Ref Pt - Reference point defining end of project section |
| To Offset(mi) - Distance from a reference point, defining end of a project |
| Length - Length of project section |
| Left shldr width - Left shoulder width |
| Drving lane width - Driving lane width |
| Right shldr width - Right shoulder width |
| Surf dpth - Total pavement depth |
| Base dpth - Total base depth |
| Grad wdth - Graded width of section below base |
| Fin wdth - Finished width of section below pavement |
| TAADT - Truck Annual Average Daily Traffic - The Taadt, Aadt & Esals shown for each |
| AADT - Annual Average Daily Traffic - section is the total for all lanes. Example: |
| Esals - Equivalent Single Axle Loads(18 kip) - The total would include all four or more |
| - lanes of a two direction roadway. |
| Pav age - The number of years since last(20 year design life) rehab |
| Eff pav age - The effective age of a pavement based on the design life of the last rehabilitation. |
| See examples $\#1$ and $\#2$ on following pages. |
| East year seal - The last year this section was sealed Primt type Elev for Asphalt. Construction and Common for comparison provided the section of the |
| A subalt over concrete |
| Pumt does - If numt type is Flex then numt does will be Asphalt if numt type is const then |
| nymt desc will either he Cren or Jointed, if nymt type is composition nymt desc |
| will be Accrc(asphalt over crcp) or Acpic(asphalt over jointed) |
| Hwy nty sys - INT(interstate) NHS(national highway system) HI (highload) II (lowload) |
| Intl cons - Year of first construction |
| Prev cons - Year of first rehabilitation |
| Ltst cons - Year of most recent rehabilitation |
| Ltst rehab - Type of latest rehabilitation(overlays, cpr, recycleetc) |
| List remus - Type of facest remusiliation(overlays, epi, recycle) |
