

# Gravel Basics

2022 NDACE County Roads Conference

January 26, 2022 Pre-conference on Gravel Roads

Steve Monlux

LVR Consultants LLC

Missoula MT

406-544-1919

[stevemonlux@gmail.com](mailto:stevemonlux@gmail.com)

# Topics

- Gravel Performance and Costs
- Performance Problems & Solutions
- Gravel Specifications
- Gravel Pit Investigation & Drawings
- Gravel Placement and Maintenance
- Summary of Primary Points

# Gravel Performance on Arterials (100 + vehicles/day)

<b>Performance</b>	<b>Desired</b>	<b>Typical</b>
Road Surface	High speed, good ride	Moderate speed, rough ride (Potholes, Loose Rock)
Safety (Skid Resistance, Dust)	Good skid resistance & little dust	Poor skid resistance, very dusty
Blade Jobs per Year	2	10

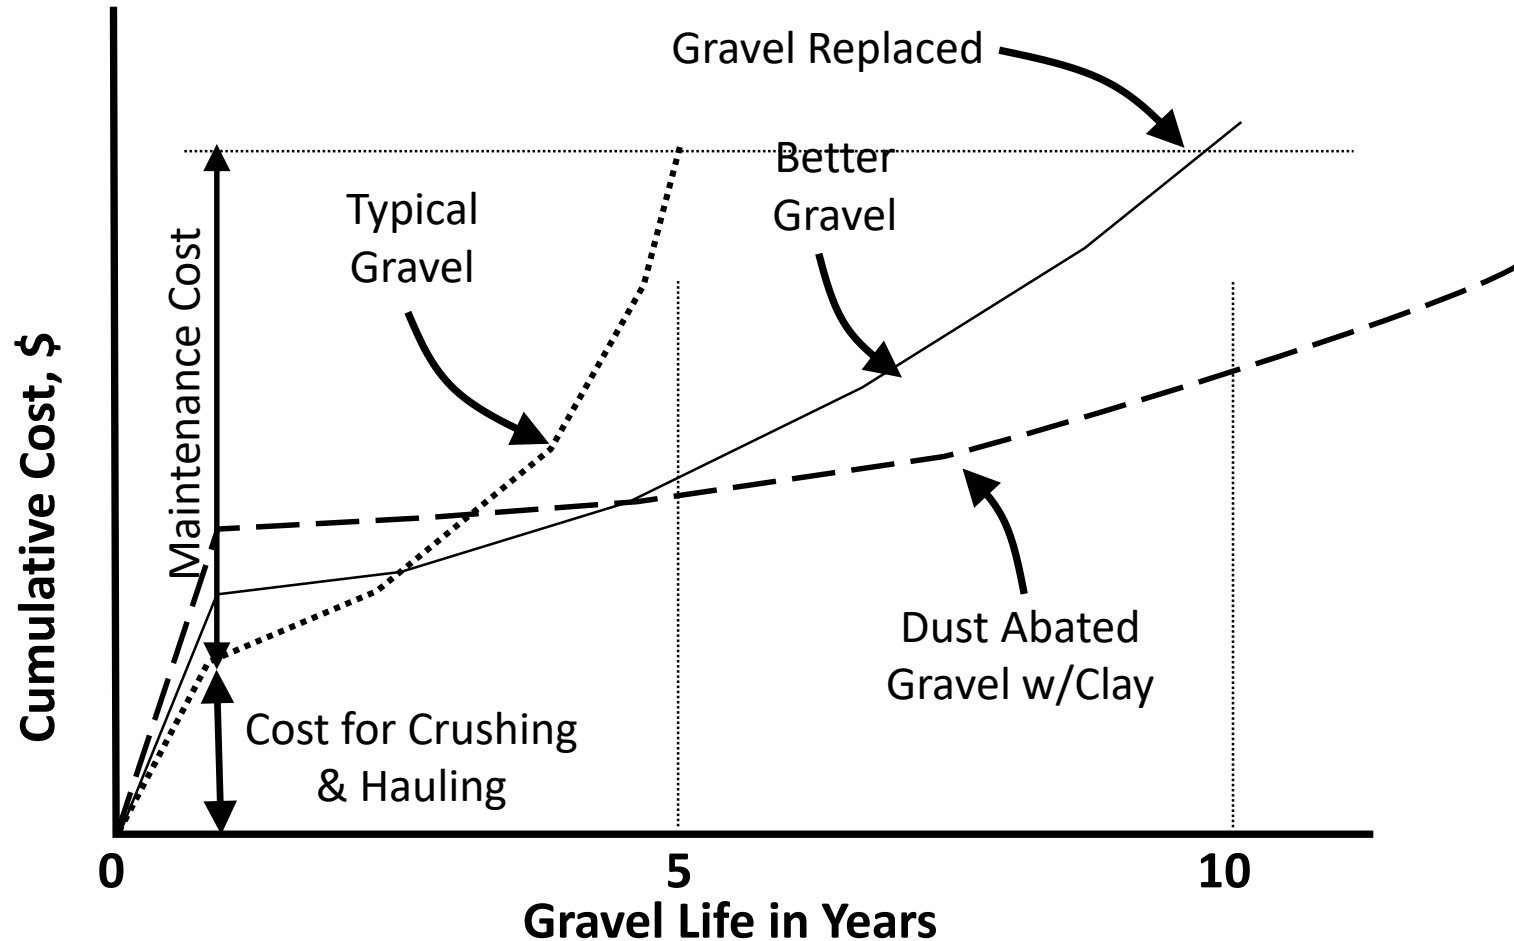

# Gravel Costs – Initial, Cumulative & Life Cycle

Cost	Desired	Typical
<b>Initial Cost</b> (Crush,Haul)	Low*	Low*
<b>Annual Mtc Cost</b> (Blading & Dust Abatement)	Low	high
<b>Cumulative</b> (Life Cycle) Cost	Low	Moderate
Life	10	5
<b>Annual Costs</b>	Low	High

\* Low Initial Cost normally causes high Life Cycle Costs

Cumulative Cost/Life in Years = Annual Cost

**Google: NDSU Local Road Surfacing Selection Tool**

# Primary Factors Affecting Gravel Life

## Factors We Can Control

- Gravel: Gradation, % Fracture, Clay Content, Compaction,
- Dust loss: Shortens gravel life
- Maintenance: Blading methods, % crown, dust control, snow removal
- Drainage: Surface & Subsurface

## Factors We Can Not Control

- Traffic: Speed, Amount & Type
- Road grades and curvature

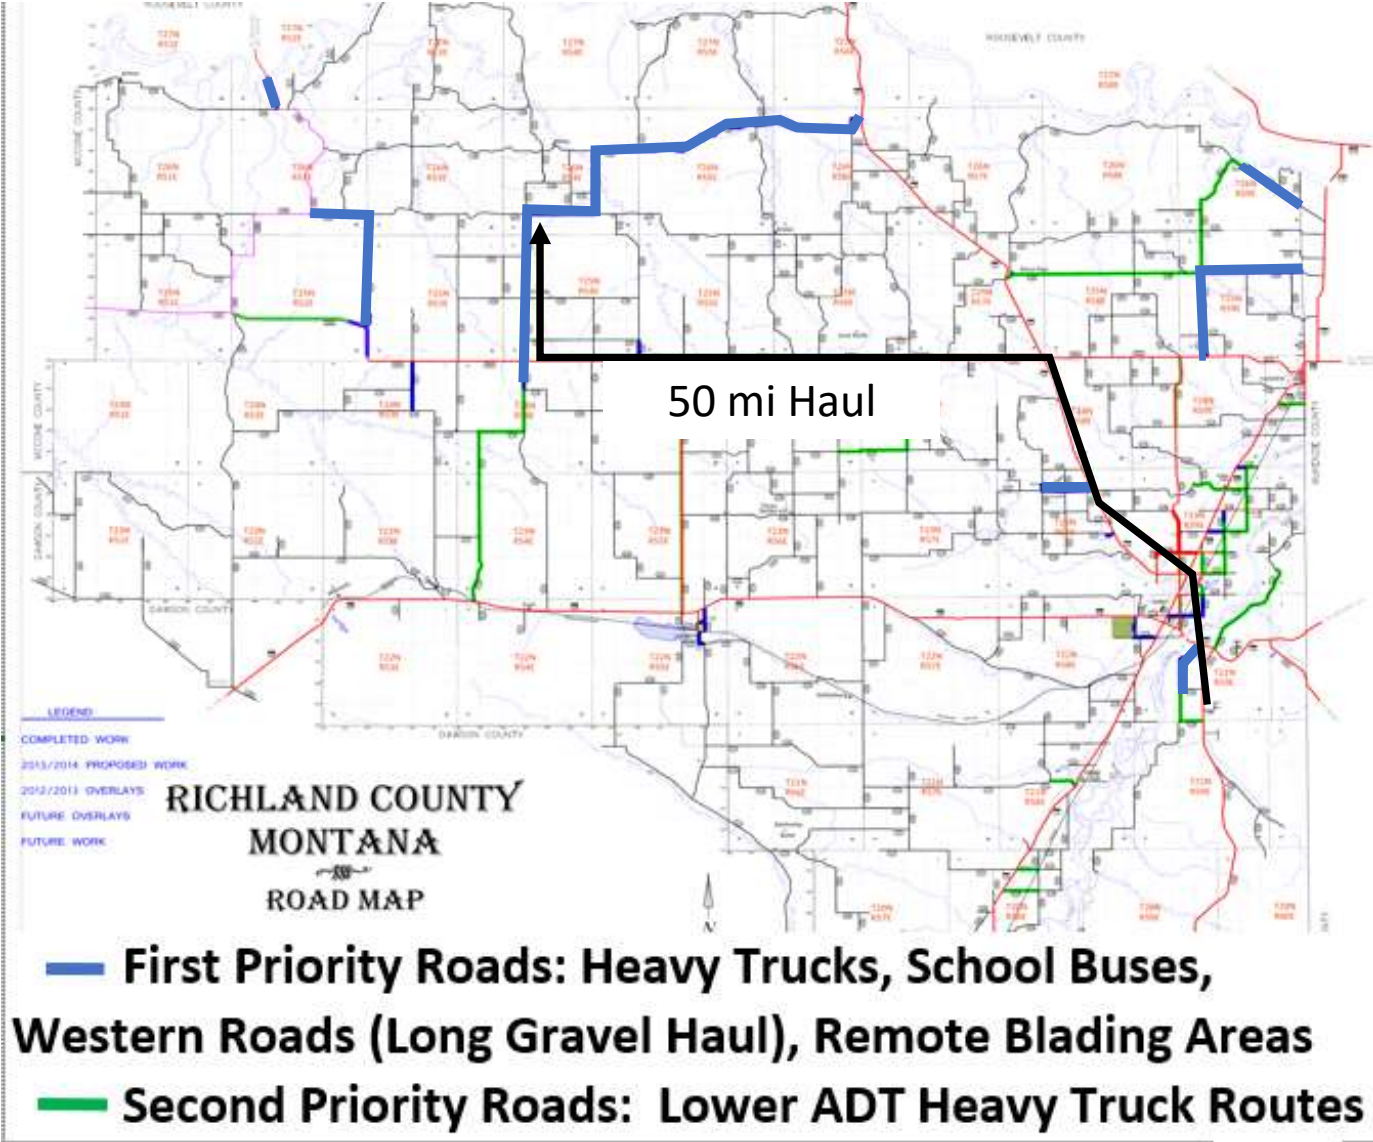

# Best Locations for High Quality, Expensive Gravel

Greatest return on investment is on Heavy Truck routes

Why?

Greatest gravel replacement

# Performance Problems and Solutions

## Problems

- Wash Boarding
- Float (Raveling)
- Dusting
- Gravel Loss
- Rutting
- Potholing

## Typical Solutions

**Good Gradation**

**Add Clay – better road crust**

Dust Abatement

# Washboarding

## Solutions

Better gradation – less sand  
Add clay – better road crust

**Note:** Rebuild crown and check gravel thickness before adding clay  
– some gravel is too worn out for this option to work well

# Float (Raveling)

Large vs Small top size  
Strength vs Resistance to  
Raveling (Float)

# Dusting

## Solutions

Chloride treatment  
Better gradation  
Add clay – better road crust

**Note:** Rebuild crown and check gravel thickness before adding clay  
– some gravel is too worn out for this option to work well

# Rutting

1.7%  
Crown

**Solutions**  
Less clay  
Higher crown  
Increase gravel thickness

# Potholing

**Solution**  
4 to 5% crown

# Problem and Solution Summary

## Problems

- Wash Boarding
- Float (Raveling)
- Dusting
- Gravel Loss
  
- Rutting
- Potholing

## Typical Solutions

**Good Gradation**

**Add Clay – better road crust**

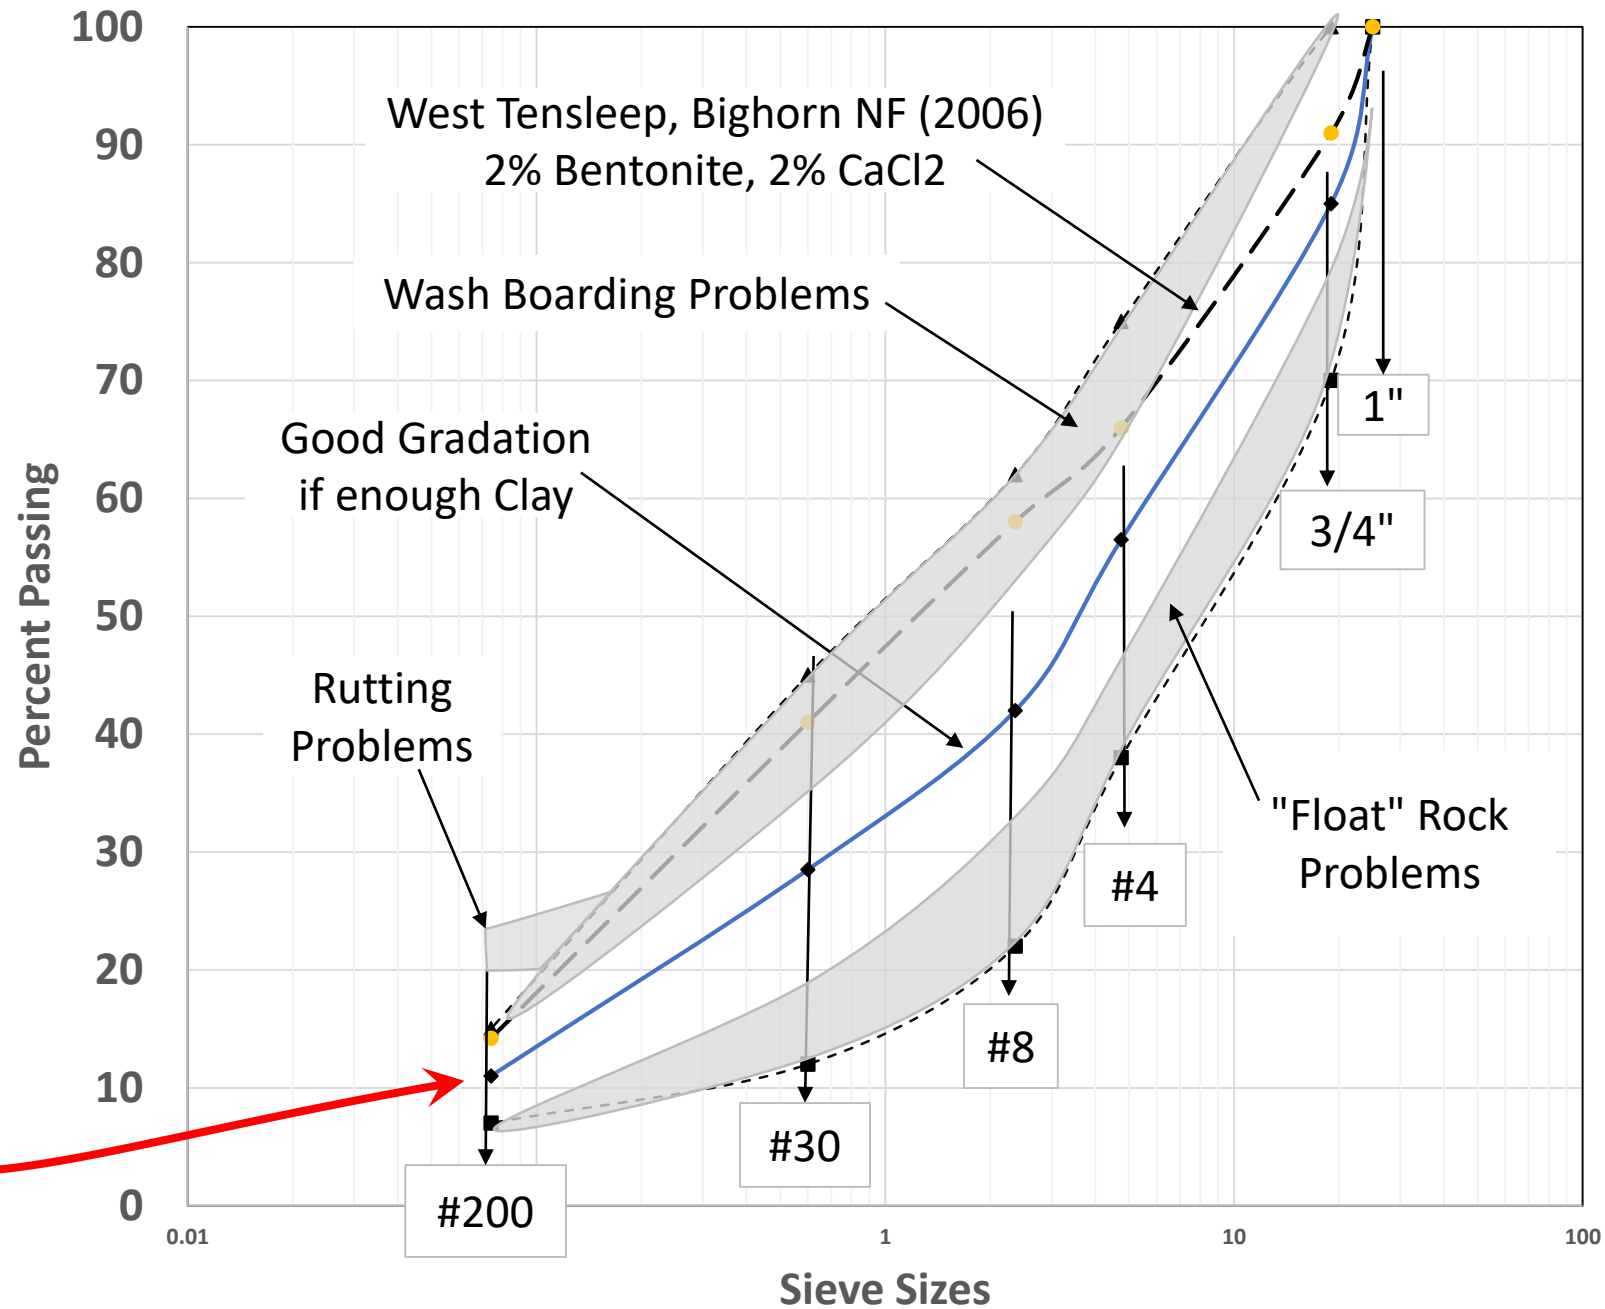

Dust Abatement

Good Gradation, more thickness,  
higher crown

4 to 5% Crowns

# 714 & SSP 6 Gravel Gradation Limits

Std Sieve	Limits		Spec Center
	Low	High	
1	100	100	100.0
3/4"	70	100	85.0
#4	38	75	56.5
#8	22	62	42.0
#30	12	45	28.5
#200	7	15	11.0

# Gradation Rating Exercise

Raveling  
or Float

**Too Much Rock.  
Problems?**

**Good Gravel Surfacing Gradation.  
Problems?**

Best Performance if  
enough clay

Wash Boarding

**Too Much Sand.  
Problems?**

# Specification & Contract Options to Consider

- Tighten gradation limits where realistic for specific pits
- Index Minus #200 to PI →

% Passing #200	8 to 14	12 to 18
Plasticity Index	6 to 10	3 to 7

- If designated pit does not have clay for plasticity, use optional bid items for both of the following
  - Meet PI specs using clay from private sources
  - Add 2% bentonite to the crushed gravel by bin feeder and conveyor belt →

- Include statement on Pit Plan Drawings: “Other private sources of gravel or clay additive may be used provided the gravel is stockpiled in the provided pit”.

# Additional Spec Options For Stockpile Contracts

- **Sampling & Testing:** Daily Acceptance Sample tested by Certified Lab (See Next Slide)
- **Payment:** Use Average Test Results and Simple Pay Adjustment System with 5% Bonus
- **Measurement:** Pay by Drone measure of Cubic Yards in Stockpile – 90 to 110% of specified

# Best Practices for Sampling & Testing

(AASHTO T2 or ASTM D75)

- Take full loader bucket samples every two hours

- Form a sampling stockpile throughout day

- Back drag stockpile to flatten

- Take two composite samples at the end of each day - minimum of 140 lbs. for 1" minus

- Fill at least two 5 gallon buckets from the same locations – Contractor tests half the sample, Engineer tests the other half for acceptance testing

- Follow AASHTO T2 or ASTM D75 Procedure

# Quantity Assurance

- Cubic Yards for Stockpile Contracts – measured by drone
- Agency pays for two surveys:
  - Stockpile floor
  - Stockpile
- If quantity less than 95% of specified, Contractor crushes more gravel and pays for final survey
- Pay on actual cubic yards in stockpile between 95% and 105% of specified quantity

# Gravel Pit Investigation

- Purpose → Reduce Costs
- Objectives for Both Existing & New Pits
  - Determine Layer Depths
  - Determine/Confirm Quantity & Quality
- Location of New Pits
  - NRCS WSS and Vegetation on Google Earth Image
  - Road cut slopes

Gradation  
Clay Content  
Hardness  
Durability

# NRCS Web Soil Survey (Slope Co & Knife River)

Sieve Sizes	
Spec	WSS
1"	1"
3/4"	3/4"
#4	#4
#8	#10
#30	#40
#200	#200
PI	
Depth, Inches	

If you have to reject sand to get in spec, add overburden with high minus #200 and PI to reduce costs

# Gravel Pit Drawings

- Mine boundaries, backslope ratios etc.
- Overburden and gravel layer depths, etc
- Test pit locations and depths, **pit run gradations,** plasticity index test data, old crusher contract test results, etc
- Precautions: meeting specs may require more crushing/screening equipment, selective mining, importing gravel or clay from private sources, etc
- Disclaimer – Quality and amount of gravel between test pits is not known

# Gravel Placement and Maintenance

- Water is Critical
- Spreading and Processing
- Crown Building
- Compaction
- Making Road Surface Crust

# Water is Critical

- Best Location to Add Water – On the Crusher Pay Belt
- Less segregation in stockpile
- Less evaporation and water haul than when applied to road
- Less segregation during blade processing, less blade processing →
- Better compaction, less rolling
- Longer lasting crown

# Higher Crown Benefits

- Reduces pothole formation
- Reduces blading
- Lowers traffic speed which reduces accidents, lowers gravel loss rate
- Lowers complaints (potholes, washboards, loose rock)

# Road Surface Maintenance

- 4% to 5% Crown to Reduce Blading
- Use Water while Blading to help the following:
  - Control segregation
  - Increase density
  - Develop hard road crust
- Extend Gravel Life by the following:
  - Add clay to gravel
  - Chloride dust abatement

One time initial cost – good buy!

If Clay in Gravel, annual chloride cost can be offset by reduced gravel loss on high traffic roads

# Clay Road Crust

- Clay fills voids in gravel, forms road crust, sheds rain, retains chloride, etc.
- Chloride increases clay life by reducing dust

# Road Crust Rebuilding Process

- Blade after rains if possible
- Cut out defects, mix gravel, rebuild 4% crown
- Add water if not wet enough to compact
- Compact gravel layer
- After compaction is complete,
  - Lightly water surface,
  - Increase roller speed to pump fines to the surface.
- Use 10 mph sign to reduce pickup on vehicles

# Building a Good Road Crust after Compaction

**Wet road surface full width – try to limit runoff on shoulders**

**Lethbridge Co AB**

**Rolling “pumps” fines to surface & forms hard road crust when dry**

**Stark Co ND**

# Good Road Crust

West Tensleep Road  
Bighorn NF, Wyoming - 2006

# Summary of Primary Points

- Better quality gravel can lower long term costs
- Clay binder improves gravel performance.
- Testing for Clay is critical
- Sampling and Testing is cheap insurance
- Consider spec options that have worked well for others
- Good blading practices increase gravel life
- There are many ways to add clay while crushing, to existing stockpiles and to gravel already on the road

# Summary Continued

## **Lower Cost/CY by:**

- Investigate gravel and overburden sources, pick realistic spec limits
- Get contractor feedback on spec before advertisement
- Allow two-year crushing option

## **Lower Annual Costs (Life Cycle Costs) by:**

- Tighter gradation & PI specs
- Require PI and Tie PI to minus #200 in specs
- Test good and bad performing gravel to improve spec limits

Try something new on small scale and share results with others

# Thank You!
