

# MOUNTAIN-PLAINS CONSORTIUM

RESEARCH BRIEF | MPC 24-544 (project 575) | August 2024

## Development and Characterization of a Plant-Based Bio-Additive for Asphalt Binder

### the ISSUE

Scarcity of natural resources, environmental concerns, and emerging needs for sustainable materials have spurred the development and use of renewable and environmentally friendly materials and processes. In response to this need, this study focused on developing a plant-based asphalt binder additive to address these challenges.

### the RESEARCH

Cellulose nanofibers (CNF) were produced in the laboratory by applying an electrospinning technique. The structure, morphology, and size distribution of the produced CNF were evaluated using scanning electron microscopy. Also, tensile strength tests in two perpendicular directions were conducted on lab-produced CNF. The effect of incorporating different amounts of CNF in three types of asphalt binders—PG 58-28, PG 64-34, and PG 70-28—on fracture energy and dynamic viscosity of binder blends were evaluated by conducting Izod impact and rotational viscometer tests, respectively. Additionally, the effect of CNF dosage in the binder on its adhesion and moisture-induced debonding potential with three types of aggregates was evaluated by conducting a binder bond strength test. In addition, the effect of incorporating CNF in asphalt mixes on their cracking, rutting, and moisture-induced damage potential was evaluated by conducting semi-circular bend, Hamburg wheel tracking, and tensile strength ratio tests.

### Project Title

Characterization of the Plant-based Bio-asphalt Binder and Bio-Additives

### Sponsors | Partners

South Dakota State University,  
Brookings, SD

USDOT, Research and  
Innovative Technology  
Administration

### the FINDINGS

The tests conducted on asphalt binders and mixes revealed that incorporation of CNF resulted in an overall improvement in binder-aggregates adhesion, an asphalt binder with a higher fracture energy and dynamic viscosity, and an asphalt mix with a higher resistance to rutting, cracking, and moisture-induced damage.

### the IMPACT

After implementation, this project is expected to result in a reduced need for petroleum-based products, which leads to numerous environmental benefits. In addition, due to the availability of biomaterials and their low cost, this project is expected to produce significant cost savings.
